

HW5 – jQuery.data()

For this homework I made a page that reads a JSON file with pizza sizes and toppings, and stores their corresponding prices with the data() method of jQuery.

It can be found at: <https://blank-cawobu.backliftapp.com/pizza/pizza>

Like the “translation” example app provided I iterated through the JSON file and generated buttons that had the “price” data attached to the element. This is not used on the page until the user clicks a button, and then the data will be grabbed and put into the price table on the right of the page. Another data attribute is assigned to that element, used to calculate the total cost.

Here are some screen shots:

Pizza Price

Select your pizza size and topping on the left to see the price on the right.

Select a size:

Choose your topping:

Your Pizza

Item	Price
Total	

Your Pizza	
Item	Price
Personal	5.50
Total	5.50

Your Pizza	
Item	Price
Large	11.00
Sausage	2.00
Total	13.00
